The script for PLANET OF EVIL was a meeting between Doctor Jekyll and Forbidden Planet (see Id Shuff). Amongst other things, this gave the designers a powerful set of visuals from which to start.

Part of the strength of the MGM epic science fiction film Forbidden Planet made in the nineteen-fifties was the impressive sets and visuals. Several of the visual ideas from the film found their way into

Set design

PLANET OF EVIL, but modified in line with the smaller budget.

The most obvious divergence from either of the story's main influences, however, was the surface of Zeta Minor. Forbidden Planet had been set on a world largely composed of desert and rock, whereas the script for PLANET OF EVIL specified a jungle-planet (see Evil Thoughts). Sufficient money was allocated to the programme for director David Maloney to be able to give designer Roger Murray Leach the go-ahead to build a sizeable jungle set in the BBC film studios at Ealing.

The finished result was so impressive that colour stills of it were used in BBC Educational Services publications about sets and their design for several years. (The jungle photograph on the cover of this issue is one of the stills used.) The creation of the jungle was a collaboration. Dave Havard, visual effects designer, provided the weird, vacuum-formed plants which gave the undergrowth some of its more vividly alien feel.

The resulting film set was extremely crowded, despite its large size. It was lit mainly in blue and red, and included rock pools, dry ice outlets, forced-perspective backdrops, and an abundance of vines and creepers suspended from the gantry. There were also trees carved out of jabilite. These were firmly fixed to withstand the force of the wind-machine used to convey the movement of the invisible monster through the jungle.

To make it appear even more impressive, the film set was designed to be shot from several different angles. This provided a greater choice of camera angles and increased the apparent size of the jungle. Two film cameras were used. The use of wide-angled lenses for long shots made the set appear bigger again. The use of two cameras also meant that each scene could be filmed twice at once, so needed playing fewer times.

One disadvantage of the size and complexity of the set was that it was often difficult and sometimes impossible to position sound booms. As a result, much of the dialogue in the film sequences was post-recorded and dubbed on to the finished film later.

By contrast, the rest of the sets were fairly straightforward. The survey base was suggested by the entrance pit into the jungle. In both the base and the Morestran Probe ship, stock control panels (seen previously in, for example, THE ARK IN SPACE, serial 4C) were used.

"Our sun is dying. By taking material from this planet we can refuel it and save our civilisation"

Another limitation caused by the crowded design of the jungle was the manifestation of the Anti-Matter monster. The ideal was to achieve by relatively cheap electronic trickery what MGM had done with expensive animation from the Disney studios. Costume designer Andrew Rose devised a silver, padded half-costume for the creature. Shot in
high contrast under coloured spotlighting and enhanced by use of a spark machine, the monster's

**The monster**

outline was electronically tinted red, then overlaid on the video picture as required using ChromaKey. Philip Hinchcliffe explains: "The monster was done with an image enhanced from a spark machine, and coloured red. Couldn't have been simpler!"

The main problem with this approach was the limitations of the ChromaKey technology. The overlaid image could only be used realistically in the foreground of the picture. To have the creature appear in mid-shot, behind some other part of the set, would require the careful positioning of paper masks to hide part of the ChromaKeyed image seen by the camera at the Inlay Desk.

**Animation and masking**

PLANET OF EVIL did make small use of the animator's art. The force field effect as the monster attempts to enter the Morestran Probe ship in episode two was an animated effect.

The end of episode two also used masks, despite the difficulty and time involved in their construction and positioning. A mask was used for the mid-shot of the creature rising out of the black pool. The mask hid the bottom half of the monstrosity's body, supposedly out of view below the surface rim of the pool. However, while this could be achieved with a simple one-piece cut-out mask, it was decided not to attempt the huge effort of devising elaborate masks necessary to matte the monster into a shot of the complicated jungle set, with its dense and oddly-shaped vegetation.

Since most of the filmed jungle sequences with the monster were long shots, the monster's passing was achieved by the use of the wind machine and manipulating bits of scenery to imply that the

"Here, on Zeta Minor, is the boundary between existence as you know it and the other universe which you just don't understand. From the beginning of time it has existed side by side with the known universe, each is the antithesis of the other. You call it 'nothing', a word to cover ignorance. And centuries ago scientists invented another word for it — 'Anti-matter' they called it. And you, by coming here, have crossed the boundary into that other universe to plunder it. Dangerous...""

invisible monster had gone by. This had the added advantage of keeping the sight of the monster from the audience until the end of the first episode. It was also consistent with the fact that the bodies of the monster's victims disappeared for a while after they were attacked, to be replaced later by the dehydrated and shrunken 'hunks'. Use of the monster on film was confined to the the Doctor's trip into the alternate universe, starting with his fall into the pool at the end of episode two. As with the falling-through-another-universe sequence in INFERNO (serial DDID) fifteen years earlier, the scene was shot on film, using distorting mirrors.

**The Morestrans**

The Morestrans reflected their Forbidden Planet templates in many respects. As in the film, they had a twin-decked spaceship, and they wore bulky, padded space fatigues. The military personnel had blue uniforms, the scientific
PRODUCTION

The expedition's uniforms were the same design, but brown.

The original expedition, we are told, was of eight people. The grave marker positioned by Braun read: KARL LUMB DIED HERE 5/4 IN THE YEAR 37,168. The Morestrans' small arms were working props, which detonated a flash in the end of the gun on cue. A star filter fixed to the appropriate camera amplified the flare effect generated as the guns fired.

The shape of the Morestran Probe ship was agreed early in the production cycle since the model had to match the full-size landing-leg seen in the live action sequences. The ship's doors were coded with various symbols. The deck of the ship had a main screening showing ChromaKeyed images. An example is the plan of the ship, with lights showing the hatches giving way as the Anti-Men roam the corridors. Usually the images were in colour, but the shot of Sarah and the Doctor by the edge of the black pool in episode two, and of the Doctor at the end of episode two/start of episode three were monochrome. Other scenes relayed by the Oculoid Tracker (including the Doctor's reappearance by the pool after his fall) were in colour.

Model work

The model of the Morestran Probe ship was constructed of wood and plasterboard over a metal armature. It was actually more complex than it appeared on film. An internally-fitted battery powered a whole series of beacon lamps and porthole lights designed to indicate the real scale of the craft. Unfortunately, the lights failed to show on the intensely lit model stage where it was filmed. To save on studio set costs, Visual Effects also supplied a model of part of the Probe's interior corridors. This was used for the sequence of the inter-section hatches being closed in an attempt to contain the Anti-Matter monster.

Other models included the planet Zeta Minor, which was used in the establishing shot for the story (fading into a shot of the jungle) and later with the Probe ship model. One model of surface detail of the "last planet of the known universe" was also made - of the area around the Black Pool. This was only shown once, briefly, as an establishing shot in episode one immediately after Sarah's "I may have better fortune." The final shot was also a model sequence, that of the TARDIS spinning through space which had been filmed for the story made immediately previous to this, and shown immediately after it - PYRAMIDS OF MARS (serial 4G, see next issue).

Two sections of the Probe ship's hull were also made as models. Each had a hatch, from which another model was 'launched'. One was the sealed coffin containing Morell's body. This was seen leave the hatch, then shown moving away from the ship model. The other model dispatched from the ship's hull was the Oculoid Tracker. This was a circular craft, flown on wires, down which a small current was passed to operate the solenoid-controlled camera 'eye' which could swivel left and right.

The only other model used, curiously, was the stock three-foot tall TARDIS. This was used for its dematerialisation from the shore of the pool towards the end of episode four, presumably to enlarge the apparent size of the area. A rock wall vignette was superimposed over the pool-side to increase its apparent scale too.

Transformations

Sorensen's transformations into Anti-Man were done in four rigidly-defined stages. All the scenes of him in full make-up were recorded first, and then of him in a near-normal state were done last. It was deemed easier and less time-consuming to have actor Frederick Jaeger fully transformed during the morning, and then to remove make-up appliances bit by bit throughout the day.

The four stages stipulated in the recording (see RX) were:

1. Eyes - thin strips of paper painted with ChromaKey powder. This was for the sequences when Sorensen sees himself in the mirror with his eyes glowing red.
2. "Teeth bits" - half-way, with false teats, wig and facial make-up.
3. "Total", using a different wig, facial hair and make-up, longer nails. By contrast, the effect of the Anti-Matter rocks changing state and colour was achieved merely by altering the studio lighting on the canisters.

A multiple roll-back-and-mix accomplished the effect of Sorensen dividing into several red-outlined Anti-Men. After this two walk-on actors, Roy Knight and Douglas Stark, also portrayed Anti-Men. They were also in full make-up for the scenes where their red outlines roamed the ship's corridors, breaking through the hatchways to the accompaniment of dry ice and sound effects.

In the studio

The sound effects for the story were provided by Peter Howell, filling in while regular Who Special Sound man Dick Mills was on holiday. Max Faulkner and Terry Walsh were back in their usual capacity as stunt men (doing such stunts as falling from the gantry of the Morestran Probe when the monster attacks in episode two). Terry Walsh doubled for both Tom Baker and Frederick Jaeger for the scenes in which first the Doctor, and later Sorensen fell into the black pool. The Doctor's fall into the pool at the end of episode two was frozen as the screams into the theme music overplayed it.

PLANET OF EVIL entered studio TC6 on June 30, 1975 just three weeks after the completion of PYRAMIDS OF MARS. The TARDIS interior scenes were not shot until the second recording block, mainly, for episodes three and four, and commencing July 14, in TC1. All the Zeta Minor video scenes were shot in the first recording block. The only planet set which was reassembled for the second block was the black pool and its environs. The rest of the second recording block concentrated on the sequences within the Morestran Probe Ship. Several scenes recorded were edited out for reasons of time (see script extract for an example)

A short scene cut from the transmitted version of the programme

4. IN+VISION
"They wanted to get away from relying on races of rubber-suited monsters" recalls LOUIS MARKS

Full Marks

He returned to writing for Doctor Who after a break of three seasons (his previous story being DAY OF THE DALEKS, serial KKK, broadcast in January 1972). As a script editor, with ex-Who producer Innes Lloyd, Louis Marks had commissioned such television as Nigel Kneale's The Stone Tape. Later they were responsible for a series of six supernatural drama plays for BBC2 under the banner title Dead of Night. Louis Marks told IN*VISION about his approach to writing in general, and about PLANET OF EVIL.

STARTED my writing career at a very simple level with things like Robin Hood. I wrote several episodes for that, and also did my first script editing there too. I then script edited a long-running police series called No Hiding Place which started life very definitely pre the violence of Z Cars. It didn't begin that realistically, although as we went along we tried to get it as realistic as possible because we acquired good police and criminal advisors. As far as I had any influence, I tried to move forward the characters of the criminals. The police worked side was still very formula, driven by procedure and the laid down rules of the series. So I tended to believe there were more ways we could do concentrating on the criminals — villains are often more interesting characters anyway.

I suppose in essence I do like to feel that you're going to get an audience to feel something, that there'll be some emotion generated by what you put on. My preference — certainly as a producer, and I don't think I was different as a writer — is for drama that is up-front in its emotions. I've sort of reacted against the over-sophisticated, laid-back, understated tradition of television writing. I like an emotional punch. I like people to watch and be moved, inspired or at least touched by whatever the mood is being conveyed.

The main word, I think, is feeling. Whatever the dramatic passions are — hatred, disappointment, jealousy, ambition, tragedy — those elemental qualities in a production are what attract me most. I don't think fear and dread, the clichés for Doctor Who are aspects in themselves which directly interest me. Except insofar as they lead to an emotional climax or to an emotional fulfilment in the story.

Drama, since its inception (and I don't think television drama is fundamentally different) should go for lust. Historically, death is an important ingredient in drama; playing literally for life or death stakes in a situation. Somebody not quite dying is not as dramatic as somebody actually dying.

The idea behind Dead of Night, for instance, was quite interesting. It wasn't that any of us was particularly interested in ghost stories as a genre. The notion was to go to a number of leading contemporary television writers, and say: "Express your feelings as a person through the medium of a ghost story. Use that as the discipline through which to write your play." That immediately focused their minds. So Don Taylor, who is a radical, somewhat.
left-wing author very committed to expressing political views, wrote a ghost story about a social issue. The Exorcism was about the way a family had been treated in the early eighteenth century, how they had died of starvation through a terrible act of social injustice which then pops up again to haunt the people living in the twentieth century. The risk with a ghost story is that you're straying into the realm of the melodramatic — you're dealing with the borderline between the credible and the incredible. But I don't think that matters. It's the stirring of someone's emotions which makes the difference between what is acceptable as drama and what is unacceptable, no matter how fantastic the idea behind it.

The very first Doctor Who I wrote, which became PLANET OF GIANTS (serial), was inspired directly by my reading of Silent Sphyg by Rachel Carson. Her account of how everything in the countryside was being affected by the indiscriminate use of insecticides quite moved me, and so it was an easy transition to take the formula of Doctor Who and make the travellers come back reduced to just an inch high. Then I had them walking around at ground level witnessing the destruction caused by these pesticides.

On later Doctor Whos I have to admit a great debt to Bob Holmes who, I think, was an inspired script editor for that programme. He had a talent verging on genius for taking a story away from the simplistic levels of, say, Robin Hood adventure script writing, and really delving into the science fiction behind the story. In other words you'd be coming up with science fiction answers to the problems rather than Superman-style resolutions.

When Bob was appointed as Doctor Who's script editor, he knew me as a writer because we'd worked together a lot in the past, even back to the days of No Hiding Place. So he knew the kind of writing I did. We also sparkled off each other quite well which made for a very creative relationship whenever we were together. He was very modest about his talents, and certainly a far better writer than he ever realised himself. Some of his Doctor Whos that I saw were quite brilliant, especially the Chinese one (TALONS OF WENG-CHANG, serial 4S), and the one about the travelling showman in space who has a whole universe kept inside his sideshow (CARNIVAL OF MONSTERS, serial PFF). That was typically Bob underplaying his talent; he'd have such a fantastic concept, dress it up brilliantly and yet make light of it as a script.

Philip Hinchcliffe also had a tremendous input to the stories. I remember having lots of interesting and very involved discussions with both of them about what we wanted to do with Doctor Who and the trick always being to get something that would work both dramatically and Doctor Who-wise.

I have to say that there was never any intention to inject a deeper meaning into my stories other than to get a good thrilling yarn at the end of the day. But similarly, it is also true that there is something in the nature of Doctor Who, and I can't tell you what it is even though I believe it is what accounts for all the public interest in the show. There's a kind of rich vein of inventiveness that gets tapped whenever you start working on Doctor Who, perhaps because — even if only unconsciously — you're avoiding doing the obvious.

The bottom line in plotting would be, say, to arrive at a situation where you're thinking: "How do we get them out of this one?" Clearly, in purely melodramatic terms, someone can produce a sword or a gun and they can fight their way out. But Bob would always say, "No, that's wrong. That's not what Doctor Who is about." Doctor Who is about taking that situation and using the Doctor's intellect to turn it round in a cleverer way. In other words, you're encouraged to dig deeper and find out what the story is really about; to find what is the science fiction idea behind it and see if you can use that to solve your plot problem.

I suppose if I have a fault as a writer, it's a tendency to want to get serious. And Bob was always a good antidote to that, because he liked to keep things as light as possible. My failing is I don't automatically go towards humour and lightness. My nature is more for mood and tension. Also, a lot of the best Doctor Whos were ones in which, in the end, contained some kind of serious idea at the heart of them. They worked better and gave you a point of reference to go back to if you ever got lost in the plotting.

In terms of developing a story, Hinchcliffe and Holmes handed you the basic requirements for a story, and those were very rigid. The story had to work through action. You couldn't stop and just talk about it. Every other page had something had to happen. So I would usually start off with a one-line idea.

PLANET OF EVIL was a strange one because it changed direction as we went through. The Jekyll and Hyde business was certainly there right from the start, but the anti-matter theme tended to take over more and more as I worked at the plot. I read a lot about anti-matter beforehand from writers like Asimov to get some thoughts and get the brain cells ticking over. But the more I read, the more I got into the subject. Consequently, I ran into a bit of trouble when it was suddenly realised we were halfway through the story and the Jekyll/Hyde monster hadn't even appeared yet!

Ultimately the script went through several versions. The first version did rely a little too much on simple action to set it. But we'd got ourselves into such a strange world with this planet on the border of matter and anti-matter which we had to show changing mood and nature as it went from night to day and then back to night again.

At one point things were getting very complicated, although that was when Bob was at his best, bringing the plot back on course while keeping within the scientific framework we'd set up for the story. It almost got out of hand because we were getting near to crossing the line between what people will accept as credible and what they won't. That again is one of my pet peeves. I like trying to take my subject matter as far as I can go because I think they're better stories at the end when you do entice people's imaginations. If they're just getting back to what they know already, then that's the dullest form of plotting around.

What you're relying on, though, is that it will all come together on air: the script, the acting, the directing, etcetera. The play I'm producing at the moment, Precious Bane, is a melodrama set in England in the early nineteenth century which borders on that edge. It could be wildly over the top, because you're seeking in mind that with the famous Victorian melodramas, people didn't believe in them. They laughed at them. And this play could go into that area. But alternatively, that's what attracted me to it. I like treading tightropes.
as the red-outlined monster, are scandalously close to the original. More subtle derivations from Jekyll and Hyde can be found in the "visible misgiving of the flesh" felt by the sensitive Sarah Jane when the monster approaches.

Doubtless serendipity played a hand in colouring the refined antimatter one as a red powder, which changes to green, as does Doctor Jekyll's tincture. The emphasis on the change in Sorenson's stature may also be attributed to Robert Jekyll, Stevenson's classic.

All three stories centre around "the greatest discovery in scientific history" (Sorenson). Morbius (Forbidden Planet) discovers the lost power off the Krell, an intellect capable of producing perpetual energy... at a heavy cost. Jekyll discovers the ability to shake the "fortress of identity", at the cost of releasing Hyde, who "alone in the ranks of mankind was pure Evil".

Sorenson, then, is an uneasy amalgam of both.

He single-mindedly pursues his theories on the energy potential of anti-matter (which, with black holes was one of the more popular peripheral scientific curiosities of the mid-Seventies), with little concern for the plight of his fellows. Sorenson, unlike Jekyll, cannot be viewed as a sympathetic character. Unlike Walter Pidgeon's Morbius, he does not have a convenient daughter to show a paternal affection for.

In terms of character development, Planet of Evil owes more to Forbidden Planet than to Jekyll and Hyde — it is essentially space adventure. As a subplot there is the youthful Salamar, a modern commander, in conflict with old-hand Vishinsky. This conflict is built up slowly and consistently, moving up-stage in the final episode as the Doctor pursues the hapless Sorenson around the ship's corridors.

The influence of Robert Holmes is to be seen in the rounding out of the minor characters. De Haan is the grumbling foot soldier. Morelli is the resigned serviceman. Earth is described (in a scene cut from the final version of the story — see Production) as an "uninhabited wasteland", which may be reference to the Earth of Season Twelve or perhaps the earth after some technological disaster.

The character and relationship of the Doctor and Sarah are rounded out as the fairly roomy plot affords. The badinage of the first TARDIS scenes is one of the earliest signs that Sarah is becoming wise to the Doctor's prevarication. A curiosity of the writing is the sudden knowledge Sarah gains for this story. She is confident enough to identify the TARDIS's spectrometer and knows the sound of the compressors on the Morestran ship.

The Doctor is as arrogant and as confident as ever. Without a second thought he is off to the Pool of Nothing, proclaiming that he is "not without influence". His high sense of morality shines as in Genesis of the Daleks with his lecture to the infected Sorenson: "You and I are scientists, Professor. We buy our privilege to experiment only at the cost of total responsibility."

The statement captures the perennial dilemma of the modern scientist, latched on to by Doomsday and Survivors in the early and mid Seventies. Great leaps in technology, like the discovery of atomic fission, always have their price. In Doctor Who, the price may be the near-destruction of the universe, unless the Doctor can avert disaster. The strong ecological message of some earlier stories comes to the fore, when the Doctor guides Sorenson away from "disturbing the balance of nature" to a 'greener' source of power ("the kinetic force of the planets"). In the egalitarian world of the Doctor, the misguided Sorenson get a second chance and tradition (Vishinsky) triumphs over impetuous youth (Salamar).

In summary, Planet of Evil is typical of mid-Seventies Doctor Who. It is a solid space adventure, set in popular scientific notions of the time. It borrows heavily from the devices of some classic stories, classic because in simple terms they highlight the dilemma of the progressive scientist.
PLANET OF EVIL was the first transmitted story that was a complete break from the Pertwee influence. Philip Hinchcliffe told IN•VISION how he and Robert Holmes devised the classic stories of their era.

I HAD a very strong input into the story content of THE ARK IN SPACE (serial 4C), but the first transmitted story that hadn’t been thought about somewhere along the line, even if it hadn’t been scripted, was PLANET OF EVIL. That said, it would be wrong to assume that I didn’t have a very strong influence on all the scripts of Tom Baker’s first season (with the exception of ROBOT — serial 4A). But PLANET OF EVIL was the first story shown that was originated by me free of any other involvement.

It had already been done for the first season, but for the other two Bob Holmes and I would sit down and plan out the whole season. Basically, we’d have a chat about what we were going to do. I’d already developed all sorts of ideas about what I’d like to do. Some of those we ‘smuggled’ into the first season in various ways. I was very closely involved with TERROR OF THE Zygons (serial 4F), and those scripts weren’t yet written. I was there when they were written. So certainly how it was developed was down to the team of Bob and myself.

There was not a lot I could get into the first season. Except for THE ARK IN SPACE which I got a lot into, and TERROR OF THE Zygons (originally in that first season) we got a fair bit into — some of the effects and the general approach of the Doctor's. Anyways, at the start of a new season, we’d map out generally what sort of stories we wanted to do. Really it would be just both of us pitching in with our notions of what we thought we could do.

I’d developed a very strong idea of the sorts of things I’d like to do. Obviously there were influences on us, though — family enough looking back — I don’t think the word ‘Hammer’ ever crossed our minds. Except in the context of THE BRAIN OF MORBIUS (serial 4K), of course.

Those very basic mythic themes were things that I wanted to try and get in. And Bob and I wanted to incorporate them into things we’d either seen before, or which we had read about.

PLANET OF EVIL was based on the idea of doing a Jekyll and Hyde story. So then we had to think about how to do it. I remember thinking about it very hard, I didn’t want it to look just like Studio 1! So I spoke to Roger Murray Leach, who was to be the designer, and he said: “I can do you a good jungle, because we can do that on film at Ealing and it’ll look really good.”

So the problem then was how to do a planet that at night reveals its dark and evil side. Good idea, but would it work? It was a combination of having a good idea, then working out how we thought we could do it; of talking to the production professionals very early on so that we knew we had something strong enough.

So we already had ideas building. Bob reckoned we could do something with Jekyll and Hyde — we could do some funny things with his eyes, and have this guy sprout hair and all that sort of thing. So already we had something there we could achieve.

The thing that was a straight lift was the Id monster from Forbidden Planet. That was probably a bit too like the original. The idea was that you somehow had to discover the evil, you had to represent it in some way. So that’s what we had to get across. It was good fun.

THERE were other influences and ideas. I remembered reading in a science fiction story (I can’t remember which one it was) about a sort of travelling eye. I thought that was great, and wondered how we could do that. So I asked Roger, “Could we do a travelling eye? I’ve got this notion, but could we do it with ChromaKey?” The trouble with ChromaKey was it was a bit time-consuming. But Roger said, “No, we’ll do it on film in the jungle and just hang it on a wire. You’ll never see the wire.”
